

3D PC Based Games

Humans have used stereopsis to accurately perceive depth in their environment for thousands of years. With the evolution of computers has come the ability to extend our physical world by providing a virtual one. However, it has only recently become possible to produce these virtual worlds in stereoscopic 3D. The possible implications and applications of this advance are huge. The great majority of the 100s of the most popular PC based games TODAY can be played using interactive stereoscopic images that require NO glasses.

The gaming industry is a multi billion-dollar, highly competitive industry, which constantly makes use of the most, advanced hardware and software available to the general public. One only has to look at the evolution from pac-man style platform games to the hugely popular Doom style 3D games to realise the heightened experience when playing these games interactively in autostereoscopic 3D. This will further enhance the players's sense of realism and enjoyment, in addition to making games with an autostereoscopic 3D element easier to play.

Imagine immersing yourself in the world of 3D content like never before. Monsters, bullets, and landscapes jump out of your flat monitor and into your imagination, making you part of the game. With autostereoscopic technology, gaming has moved to a whole new level.

INTERACTIVE AUTOSTEREOSCOPIC 3D STARTER KIT:

Order Your Virtual Window 19 Now! and download free autostereoscopic 3D Drivers from Nvidia.
